Three phyla | 3DI | 30-tip pruned display (not re-inferred)

528 retained references | Original model: GH_AF_3DI+F+R10 | Columns: Reference cluster ID / Order or Family / Class / FAA length (aa)

Midpoint root: centre of the longest tip-to-tip path; not an independently validated biological root.
Branches: Order / Family shades linked to Class ring colours. Same-Class ancestral branches: Class tone. Mixed-Class branches: grey.
Class ring/strip retained. Host and Environment annotations omitted; 30 tips pruned in total (8 prior + 22 current); exploratory display.

Outermost bars: original, unaligned FAA protein length (aa); zero-based linear scale 0-3000 shared by AA and 3Di.
Black dots: original 558-tip SH-aLRT >=80 and UFBoot >=95; not recalculated. Support on merged paths omitted.
Retained pairwise distances are unchanged. This is pruning for display, not new phylogenetic inference.
