

DJR-MCP Finder v0 versus v0.1: remote-component development audit

Strict ultra-remote inference is blocked (qcov $\geq 80\%$, identity $< 20\%$: n=1 independent component).

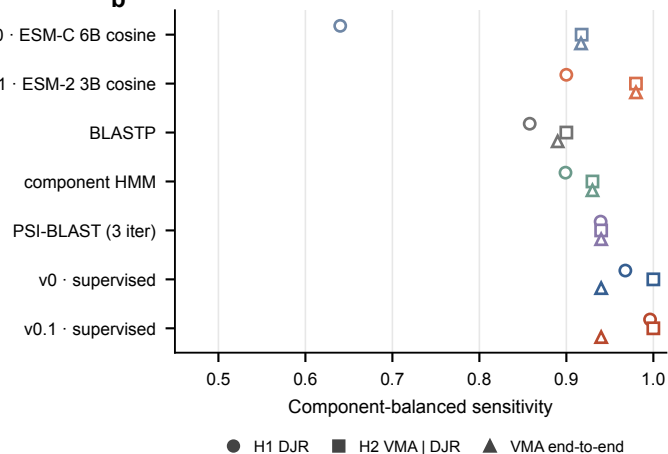

a

Paired change at calibration-fold-locked 99.5% specificity threshold

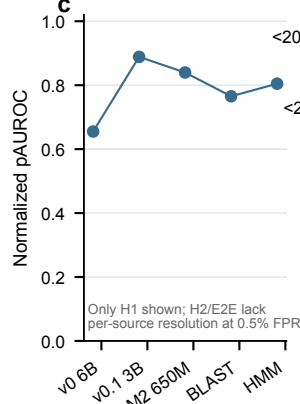

b

BLAST-defined low-coverage stress (qcov $< 80\%$)

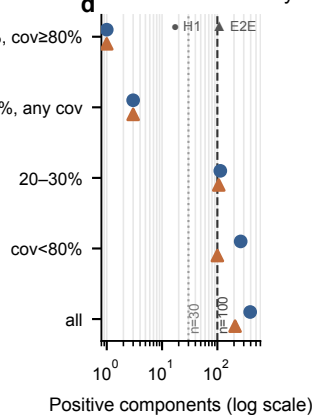

c

All holdout · FPR ≤ 0.005

d

Evidence sufficiency

Train-only cyclic component crossfit; BLAST-derived strata are descriptive and method-conditioned. Open symbols: v0 or v0.1 missed actual 99.5% specificity in ≥ 1 fold; intervals use fixed calibration thresholds and exclude calibration uncertainty.
