

# DJR-MCP Finder v0 versus v0.1: remote-component development audit

Strict ultra-remote inference is blocked (qcov  $\geq 80\%$ , identity  $< 20\%$ :  $n=1$  independent component).

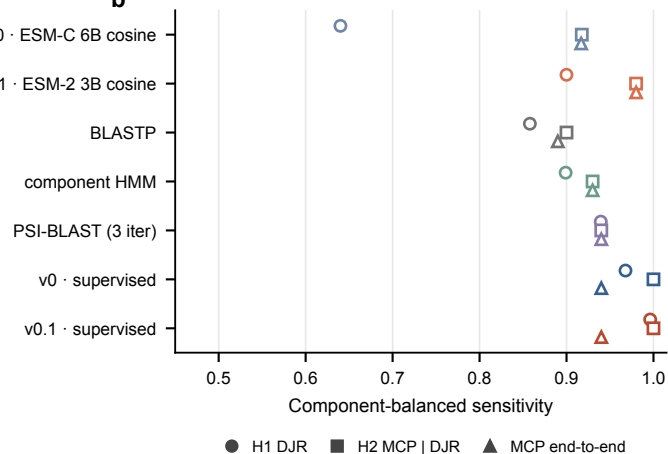

**a**

Paired change at calibration-fold-locked 99.5% specificity threshold

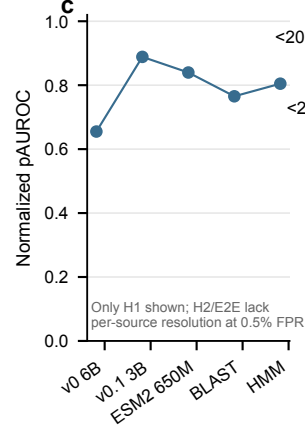

**b**

BLAST-defined low-coverage stress (qcov < 80%)

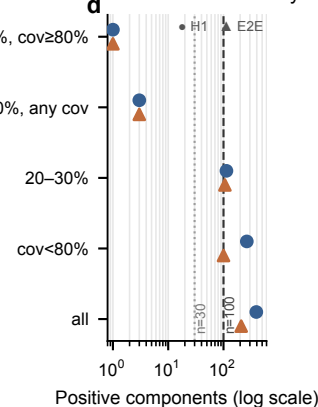

**c**

All holdout · FPR  $\leq 0.005$

**d** Evidence sufficiency

Train-only cyclic component crossfit; BLAST-derived strata are descriptive and method-conditioned.

Open symbols: v0 or v0.1 missed actual 99.5% specificity in  $\geq 1$  fold; intervals use fixed calibration thresholds and exclude calibration uncertainty.
